

★ 3rd place — Hedera Apex Hackathon 2026

The autonomous back office for tokenized assets.

Issue an **ERC-3643** permissioned token in one command, and an AI agent enforces KYC & OFAC on every transfer, pays USDC coupons, updates NAV, and settles at maturity — across **9 networks**.

SETTLES ON

ERC-3643 + HTS + Token-2022 **9** networks **19** contract tests, source-verified

THE PROBLEM

You tokenized the fund. Now you run it — forever.

01

Coupons on the clock

Hundreds of holders, paid pro-rata, every month. Miss a date and you breach the prospectus.

02

Every transfer is compliance

KYC each holder, screen against OFAC, enforce Reg D / Reg S — on every trade.

03

NAV & reports

Reprice when yields move, file reports regulators trust, quarter after quarter.

04

Maturity

Redeem principal and retire supply, correctly, at the end.

On-chain RWA today · rwa.xyz

Issuance is a one-time event. Lifecycle is the cost that never stops.

ONE INSTRUCTION · THE FULL REGULATED LIFECYCLE

One command. Full autonomy.

The fund manager issues an asset once. An AI agent runs its entire life on-chain — no human after issuance.

Issue 01 Deploy an ERC-3643 (T-REX) token + dedicated audit topic in one factory transaction.	Onboard 02 Grant on-chain KYC after rapidfuzz OFAC SDN screening of names and wallet addresses.	Enforce 03 The token's transfer hook gates KYC, jurisdiction (Reg D / Reg S), lock-ups and holder caps.
Distribute 04 Pay coupons pro-rata in USDC — integer 6-decimal micro-units.	Revalue 05 Mark NAV to a treasury-yield oracle.	Settle 06 Claw back via permanent-delegate, return principal in USDC, burn supply.

NOT A QUERY ENDPOINT

It acts when no one is asking.

A query endpoint answers when called. Laminaa holds the operator key, runs on its own clock, and closes a perceive → decide → act → verify loop on-chain toward a standing mandate.

Self-triggering

APScheduler fires coupons hourly, NAV daily, maturity every 6h — no human, no prompt in the loop.

Settles real state

Signs with the operator key, broadcasts, then verifies the on-chain signature status before writing the audit entry.

● SCHEDULER · COUPON_RUN · 02:00 UTC

```
02:00:14 🔄 coupon due · AAPL26 · 142 holders
02:00:15 ✓ ofac.screen — 142/142 clear
02:00:17 ✓ pay_stable — 18,420.00 USDC
02:00:19 ✓ audit.write — tx 5gH2...9kQ
          — no human in the loop —
```

REACH INVESTORS ON ANY CHAIN

One engine. Every network.

A family-agnostic **ChainAdapter** speaks opaque token / holder / tx refs, so the core never imports a chain SDK. Adding an EVM network is a TOML entry — not a rewrite.

 Ethereum	 Arbitrum	 Base	 Polygon	 Avalanche	 Arc	 Robinhood	 Hedera	 Solana
EVM · 7 NETWORKS ERC-3643 • T-REX permissioned token + AuditLog • web3.py · token + audit in one factory tx • Source-verified · 19 Foundry tests			SOLANA · VERIFIED ON DEVNET Token-2022 • Frozen-by-default = whitelist • Permanent-delegate = clawback • Freeze authority = sanctions · atomic issuance			HEDERA · NATIVE HTS / HCS • Native KYC, freeze, wipe keys • HCS consensus audit trail • Where Laminaa was born & won		

ONE CORE, EVERY SURFACE

People and agents drive the same engine.

The core never imports a chain SDK — [routes](#) → [services](#) → [repositories](#) · [chains](#) · [handlers](#). Async SQLAlchemy throughout. Nine networks, one product.

COMPLIANCE & ASSURANCE

The right standard **on every chain.**

Regulators want enforcement and proof. Laminaa builds both into the token.

Permissioned transfers

ERC-3643 (T-REX) on EVM, HTS keys on Hedera, Token-2022 frozen-by-default + permanent-delegate on Solana.

OFAC SDN screening

rapidfuzz WRatio (~85%) on names + exact match on addresses, against the U.S. Treasury SDN list — refreshed daily.

Immutable audit trail

Access-controlled AuditLog (EVM) · HCS (Hedera) · SPL-memo (Solana) — every state change recorded on-chain.

Verified & tested

19-case Foundry suite, source-verified on each explorer; Solana lifecycle verified end-to-end on devnet.

Functional across 9 testnets · verifiable on-chain · stage: pre-mainnet, pre-revenue.

MARKET & BUSINESS

The operating system for tokenized assets.

BlackRock BUIDL is multi-billion. Securitize, Archax and Franklin Templeton are issuing. Every asset needs lifecycle management — no one has automated it across chains.

Revenue model

Fund admins charge 5–15 bps to do this by hand; the agent does it at 2–5 bps + per-asset SaaS. \$1B AUM ≈ \$200K–500K / yr recurring.

Path to \$10M ARR

At 3 bps, ≈ \$33B AUM under management — a sliver of a \$16T market by 2030.

Target customers

Securitize, Archax, Zoniq, Tokeny, Franklin Templeton — any institution issuing tokenized funds, bonds or equities.

The moat

Issuance is commoditized. Laminaa is the operations layer *above* any standard, on any chain.

Why now

RWAs are crossing from pilots to production, Token Extensions make Solana compliance-ready, and AI agents can finally run the lifecycle.

TEAM

Two founding engineers.

Built and won together — from Anna University. AI, data engineering, smart contracts and agents under one roof.

Founding Engineer · AI & Agents

Venkatesh R

Transformers & LLM serving, RLHF / alignment, ZK-SNARKs and distributed inference. Architected Laminaa's chain-agnostic agent across 9 networks. 8+ hackathon wins · ₹30L+ in prizes.

[LinkedIn ↗](#) [Portfolio ↗](#)

Founding Engineer · Data & ML

Naveen Krishnaa S

Production data engineering — ETL, Kafka, Airflow, Elasticsearch — with RAG / GenAI and cloud (Azure, GCP). B.Tech AI & ML, CGPA 9.04. HimaShield GLOF system, awarded ₹5L by MeitY.

THE OPPORTUNITY

Issuance is solved. Lifecycle operations are not.

Hand the operating burden to the agent — compliant, autonomous, and on every chain your investors use.
